Real-time rendered animation matches traditional methods for quality on *PreCure*

May 31, 2021

Animation | Technology | Film & Television | Digital Studio | PreCure

Source: [Digital Studio](#) | [See All Articles](#)

Animation has always been a laborious process in which most of the cost goes to a long period of time that is not seen before you can see final frames. Thanks to real-time technology, that's all starting to change. By taking models into a game engine, animators can make tweaks and see the results instantly, while getting a director's eye view of where their work fits into the whole picture.

# Unreal Engine is used in various fields in Japan!

- Unique point
  - Market in Japan is dominated by Console rather than PC or Mobile.  
**Strict optimization is required in many places**
  - Very large number of Custom Licensees

**What have DevRels in Japan faced  
since UE5 was released?**

# Growing Expectations for Unreal Engine 5

- **Infinite polygons** can be displayed in real time!
- **Realistic lighting** can be achieved by simply placing lights!
- You can use a variety of high-quality assets from **Megascans** for free!
- There are also mechanisms for **procedural workflows** and **open worlds!**

On the other hand,  
some opinions like...

No grass

No leaves

Oh, grass and leaves!

## Recommended System Specs

- 12-core CPU at 3.4 GHz
- 64 GB of system RAM
- GeForce RTX 3080 (equivalent or higher)
- At least 10 GB VRAM

Oh, grass and leaves!

# Character reflection is black

can NOT enter  
the buildings

**What have DevRels in Japan faced since UE5 was released?**

Vague expectations for UE5

Expectations for  
UE5

# Agenda

- Introduction
  1. Multi-frame processing
  2. Virtualization and Streaming
  3. Utilization of Existing Assets
- Summary

# Disclaimer

In this presentation,  
there will be a lot of talk about  
"UE doesn't support it" and "this is difficult"

But, **I don't mean to imply that UE5 is useless.**  
I just want to talk about the current limitations  
so that you can understand and take advantage  
of what UE5 is good at!

**UE5 evolves at a tremendous pace!**

Most of the current limitations may be eliminated  
near future.

Expectations for  
UE5

# Multi-frame processing

Temporal / Progressive processing

4K or 8K?  
High resolution always required

Frame: 57.30 ms  
Game: 14.54 ms  
Phys: 13.35 ms  
CPU: 17.33 ms  
GPU: 5.48 ms  
Display: 100.0% x 100.0%  
Draws: 5327  
FPS: 41.430

- LB Speed Down
- RB Speed Up
- LT Altitude Down  
*Perfect*
- RT Altitude Up  
*Perfect*

**4K native**  
**57.33ms**

**Upscaling 1080p to 4K with TSR**  
**26.08ms**

# Temporal Super Resolution (TSR)

- A method of upscaling by **referencing multiple previous low-resolution frames**
- Reduces the total amount of pixels computed in a single frame, thus **dramatically lowering the processing load on many**, including Nanite/Lumen

# Note on TSR

Need to **collect enough samples** to reach (converge) to the target high resolution

100%

=

Target  
High Resolution

If you render at 100% target resolution, no need to upscale  
Just output the 100% image as is.

# Note on TSR

Need to **collect enough samples** to reach (converge) to the target high resolution

The lower the internal resolution, the more frames are required

# Note on TSR

Need to **collect enough samples** to reach (converge) to the target high resolution

The lower the internal resolution, the more frames are required

# Note on TSR

Need to **collect enough samples** to reach (converge) to the target high resolution

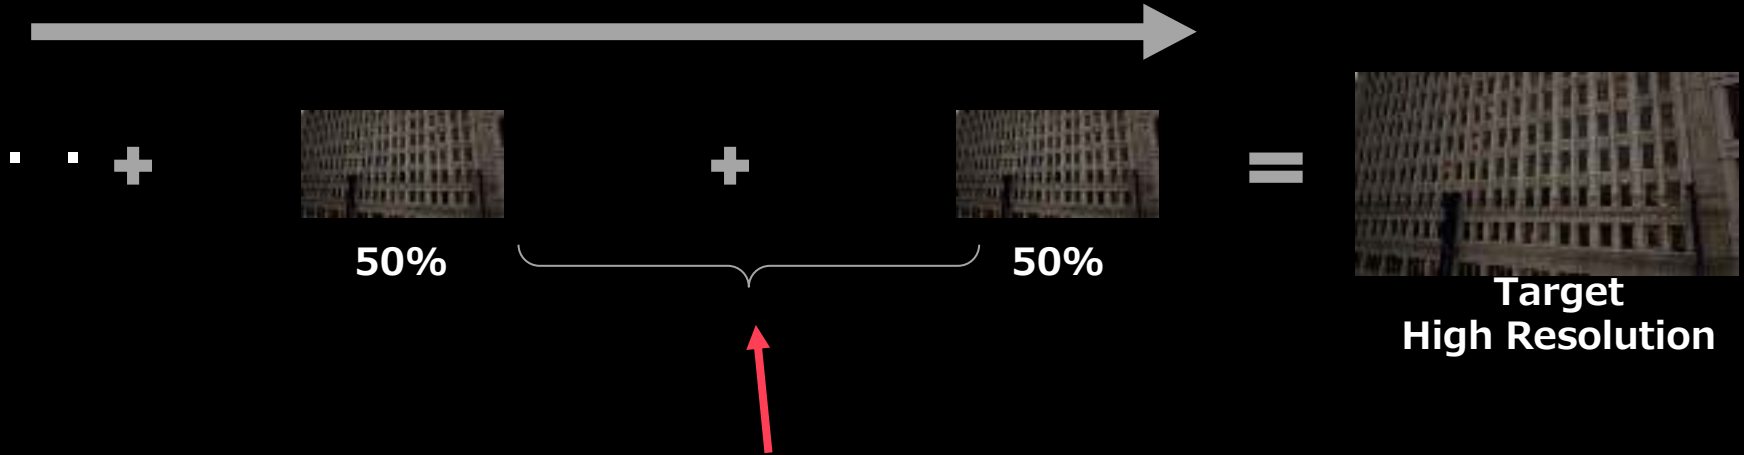

Convergence time also doubles when going from 60fps to 30fps

**When the internal resolution is too low or the frame rate is too slow, the screen can get blurred when the camera moves.**

# Note on TSR

Need to **collect enough samples** to reach (converge) to the target high resolution

Even if low fps occurs in a process not related to rendering, the image may be blurred because of the time it takes for the TSR to converge.

# TSR convergence time

- “stat tsr” command
  - use with “stat unit”
  - Good indicator for TSR flicker, delay, etc.
- The official UE5 documentation describes in detail the time to convergence under various conditions.

```
Frame: 33.17 ms
Game: 6.11 ms
Draw: 0.41 ms
RHIT: 9.17 ms
GPU Time: 10.02 ms
DynRes: OFF
Draws: 282
Prims: 14.7K
TSR feed: 3.90 MP/s
TSR 1spp: 529.37 ms
```

Screen Percentage	Framerate	TSR Convergence Rate
50%	60hz	$1000 / ((50/100)^2 * 60) = 86.6$ ms
58%	60hz	48.5 ms
66%	60hz	38.2 ms
100%	60hz	16.6 ms
50%	30hz	133.3 ms

# Another Note on TSR

need to output the correct velocity vector for each object in order for TSR to understand the change from the past frames

**Incorrect output of velocity vectors may cause strong ghosting (blurring)**

# Lumen Algorithm Overview

Can be calculated in one frame?

# Lumen Algorithm Overview

Various internal processes are split into multiple frames in order to reduce the number of processes in a single frame

Splitting into multiple frames means  
**gradually and incrementally**  
converging on the correct lighting

# Example of delay due to frame distribution

Delay for fast changes in lighting

# Example of delay due to frame distribution

Delay when switching cameras

# Multi-frame processing Summary

- To maintain real-time performance, UE5 has a process that uses multiple frames
- **Temporal Super Resolution**
  - Low internal resolution or low FPS will take more time to create a high-resolution image, making strong ghosting
  - Ghosting may occur in areas where the velocity vector is not correct
- **Lumen**
  - Lumen GI have some multi frame processings  
Lumen's GI lighting only scenes easily cause noticeable lighting delay  
In other words,  
Emissive-based lighting is still Experimental

# Nanite = Virtualized Geometry

- High-Density polygons
  - Data size is too large to fit in memory
  - Takes time to render

# Virtual Texture

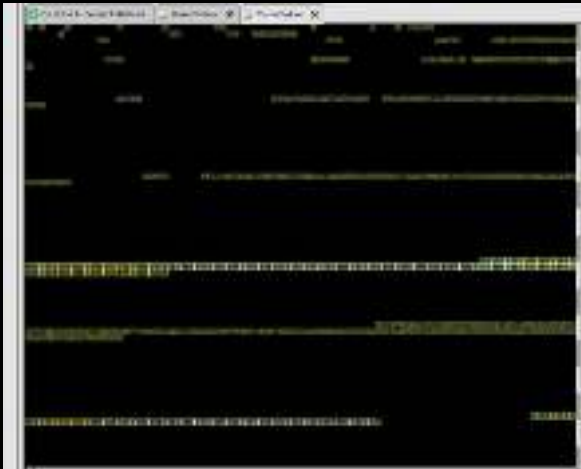

**non-Virtual Texture**

**Virtual Texture**

# Virtual Texture

- Pros
  - Only what is actually visible from the field of view can be read!
    - This reduces memory consumption by a large amount
- ↓ Visualization of a Virtual Texture memory

# Virtual Texture

- MipMap can also be read partially for each Mip tile
  - Load a detailed MipMap for nearby tiles
- Potential to significantly reduce memory consumption

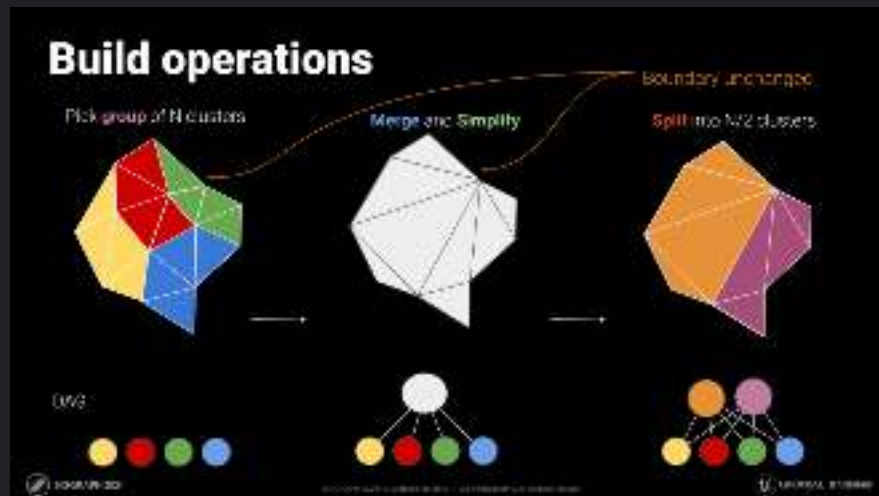

**Virtual texture can also partially load MipMaps.**

# Nanite

- Nanite is a polygon object version of Virtual Texture

- In advance
  - Clustering
  - Into a hierarchical structure

# Nanite has the same constraints as Virtual Texture

Nanite streaming may not be completed in time  
when camera cuts are abruptly switched

# Countermeasure: Cinematic Prestreaming

- When Camera cuts and objects are predetermined
  - Record and save what Nanite and Virtual Texture to load
  - By pre-loading that data during actual Sequencer playback, the delay can be reduced to zero

# Sudden camera movement or teleportation

- Streaming delay may cause low-resolution objects to be momentarily visible
  - Non-continuous camera movement
  - Transition between levels
- In such cases, it may be necessary to take measures such as fade-in

# Caution: Virtual texture's min mipmap size

- **Min mipmap size = tile size (default 128\*128 )**
  - High frequency virtual textures can cause terrible moare

Normal Texture

Virtual Texture

# Caution: Virtual texture's min mipmap size

- **Min mipmap size = tile size (default 128\*128)**
  - High frequency virtual textures can cause terrible moare
  - TSR can mitigate the issue but cannot eliminate it completely

# Virtualization and Streaming Summary

- To keep objects with huge data sizes in constant memory, virtual texture and Nanite utilize data virtualization technology
- They are loaded by streaming, so if the camera is moving quickly, the streaming may not be able to finish in time and low-resolution objects may be visible
- We have a solution for cutscenes. However, teleportation and other instantaneous camera switching is not yet supported and requires fade-in or other countermeasures

# Agenda

- Introduction
  1. Multi-frame processing
  2. Virtualization and Streaming
  3. Utilization of Existing Assets
- Summary

# Utilization of Existing Assets

Megascans / Marketplace

Image courtesy of Quixel

**You can use many existing assets for free!**

**You can use many existing assets for free!**

**Something is wrong with the rendering...  
GPU costs jump up...**

# Modular Assets vs Lumen Cards

Modular Assets: not made as a single unit, broken down into parts, which are then combined to create an object

# Lumen Cards

In order to calculate GI,  
Lumen creates Lumen cards covering each object to calculate GI

# Modular Assets vs Lumen Cards

Lumen Cards in City Sample

# Modular Assets vs Lumen Cards

- **Basic rule**

- To get Lumen working right, **create your objects with modular assets**

- Lumen Card can only create simple shapes, so if you create a complex object in one piece, there will be more areas that Lumen Card cannot consider, resulting in inaccurate GI calculations

- Pink is areas where Lumen cannot be calculated

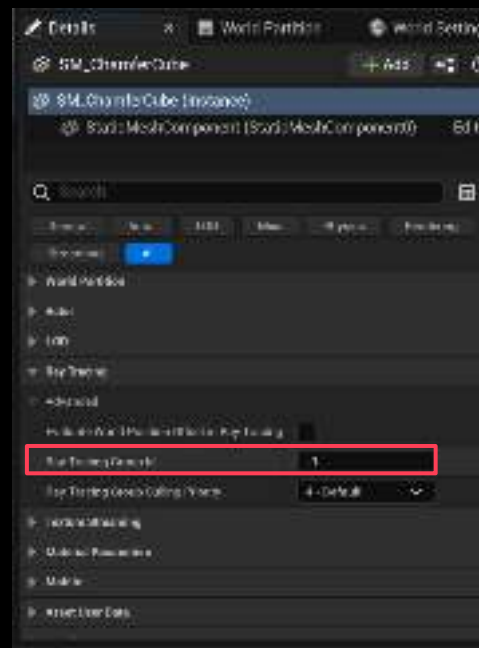

# Modular Assets vs Lumen Cards

- But... Too many modular assets increase Lumen computation

# RayTracingGroupID

- Lumen cards of objects with the same RayTracingGroup ID can be merged

# RayTracingGroupID

- Lumen cards of objects with the same RayTracingGroup ID can be combined. This drastically reduces processing load and memory usage

# Modular Assets vs Lumen Cards

Lumen Cards covering an entire building cannot cover complex objects

Can not enter  
the buildings

# Modular Assets vs Lumen Cards

Currently, there is no system that satisfies both of these requirements at the same time.

It might be necessary to separate the exterior and interior walls, etc.

# Note: Nanite restrictions

- From UE5.3
  - Masked Material is now supported! However, the processing load will be very high

Nanite

Non-Nanite

OK, I'll set all objects as Nanite except for grass and leaves!

... Does this work well?

Note: There is a difference in processing load for Nanite and non-Nanite objects on Lumen/VSM

Nanite

Non-Nanite

OK, I'll set all objects as Nanite except for grass and leaves!

... Does this work well?

# Agenda
